Florida). It was isolated from a phage cDNA library of 21-day-old wheat caryopses by screening with a PCN fragment derived from rice soluble starch synthase (see also AAV01529-30). A second clone (see AAV01528), coding for wheat granule-bound starch synthase (see AAW23938) is also claimed. These isolated nucleic acids can be inserted into vectors
                                                                                             2603

for production of transgenic plants, particularly starch-producing plants, specifically wheat. Use of the isolated nucleic acids, or of antisense sequences, allows starch metabolism to be regulated in transgenic plants. Overexpression may result in improved crop yield, while modification of starch in planta may eliminate the need for subsequent chemical/physical modification. Plants with allered levels of the various isoforms of starch synthase will produce starch of different chain length, amylose/amylopectin ratio,
                                                                                                                                                                                                                                     degree of branching, phosphate content, gelatinisation behaviour, granule size and shape, viscosity etc. The starch produced by such plants is useful particularly in foods or to produce packaging materials or disposable goods, as well as in any other known use of

Starch can be used in various conventional starch applications, e.g. starch hydrolysate products, foods, papermaking, adhesives, textiles, building materials, soil stabilisation, agrochemicals, pharmaceuticals, cosmetics, coal briquettes, ore and coal slurries, foundry casting, rubber, leather
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ing maize starch synthase type I protein - for producing

~

This invention describes a novel protein (I) with the activity of wheat starch synthase. Transgenic plants, specifically wheat, that contain (I) are used for production of starch, used particularly in foods, care used for production of starch, used particularly in foods.

Exercised and pastry goods and for making packaging materials or disposable items. Starch may also be used as starting materials for glucose or glucon components (e.g. for fermentation or further chemical conversion); in paper and pulp production, as adhesives, in textiles, in preparation of gypsum-based building materials, as soil stabilizer, as wetting agent etc. in fertilizer and plant-protection compositions, as binder (in pharmaceuticals, cosmetics, coal briquetting and casting and), as flocculant in soil or coal slurries, as rubber and leather additives, and for production of synthetic polymers, e.g. polywrethane conduct plants with increased/decreased production of (I) produce starches with altered physical and/or chemical properties such as maylose/amylopectin ratios, degree of branching, mean chain length, properties, or starch grain size or structure. This sequence encodes the soluble starch synthase isolated from wheat (Triticum aestivum L. cv. producing for synthase activity, useful g materials -Claim 1b; Page 15-19; 24pp; German packaging starch WPI; 2000-024508/03 P-PSDB; AAY50818. enzyme with foods and pa ğ

The methods and products can be used for targeting expression specifically to the endosperm of the seeds of cereal plants such as wheat or barley. They can be used for the expression of e.g. antisense sequences of granule-bound synthase (GBSS), SBE II, low mol. wt. glutenin, grain softness protein I, bacterial isoamylase, bacterial glycogen synthase, and wheat high mol. wt. glutenin BxI7. They can be used for modifying the characteristics of starch produced by a plant. The present sequence represents the wheat SSS I cDNA sequence.

This near full-length cDNA clone, designated TaSSS, codes for a soluble starch synthase (see AAW23837) of summer wheat (cv. Florida). It was isolated from a phage cDNA library of 21-day-old wheat caryopses by screening with a PCN fragment derived from rice soluble starch synthase (see also AAV01529.30). A second clone (see AAV01528), coding for wheat granule-bound starch synthase (see AAW23938) is also claimed. These isolated nucleic acids can be inserted into vectors

for production of transgenic plants, particularly starch-producing plants, specifically wheat. Use of the isolated nucleic acids, or of antisense sequences, allows starch metabolism to be regulated in transgenic plants. Overexpression may result in improved crop yield, while modification of starch in planta may eliminate the need for subsequent chemical/physical modification. Plants with altered levels of the various isoforms of starch synthase will produce starch of different chain length, amylose/amylopectin ratio, degree of branching, phosphate content, getafinisation behaviour, granule size and shape, viscosity etc. The starch produced by such plants is useful particularly in foods or to produce packaging materials or disposable goods, as well as in any other known use of

juence encodes maize starch synthase type I, useful con of starch. Starch can be used in various arch applications, e.g. starch hydrolysate products, ting, adhesives, textiles, building materials, soil agrochemicals, pharmaceuticals, cosmetics, coal and coal sturies, foundry casting, rubber, leather
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ize starch synthase type I protein - for producing ts

The present sequence is the corn soluble starch synthase (SSI) composite gene. This was used in the construction of plasmid pSS31 for the generation of an antisense construct for suppression of SSI expression in corn. The starch fine structure derived from a grain of the cereal crop can be altered in the transformed cereal crop by changes in amylose to amylopectin ratio, amylopectin fine structure, increased abundance of very short amylopectin chains and in the degree of polymerisation of amylose. These modifications can be created by controlling the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    expression of non-GBSSI (non-granule bound starch synthase) in
transgenic plants. Altered starches are useful in foods, paper, plastics

The present sequence is the corn soluble starch synthase (SSI) DNA sequence comprising the entire SSI coding region and a 3' UTR fragment proserted into plasmid pSS65-C11. The chimmeric gene containing the zein promoter followed by the 3'UTR is used as a sense construct for preparation of transgenic corn expressing altered starch structure. The starch fine structure derived from a grain of the cereal crop can be altered in the transformed cereal crop by changes in amylose to amylopectin ratio, amylopectin fine structure, increased abundance of worry short amylopectin fine structure, increased abundance of amylose the changes of polymerisation of amylose. These modifications can be created by controlling the expression of non-GBSI (non-granule bound starch synthase) in transgenic plants. Altered starches are useful in foods, paper, plastics

The isolated nucleic acid molecule can be used to produce transgenic plants with altered starch production. The transgenic plants produced using the nucleic acid molecule have an enhanced ability to produce structurally-altered star
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated nucleic acid molecule, used to produce transgenic plants - comprises nucleotide sequence encoding polypeptide having soluble starch synthase activity, where polypeptide is encoded by maize gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  synthase;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The soluble rice starch synthetic enzyme gene has, at the N-terminal, the transit peptide that is required for the transition of this enzyme to the amyloplast. Introduction of this gene into the rice protoplast augments the expression of soluble rice starch synthetic enzyme. The transit peptide coding sequence can be used for the efficient transition of any protein into amyloplasts.

                             soluble starch synthase (SSS). They were isolated from a maize inbred line W64A library by screening with a probe (AAT67288) based on pea SSS, rice SSS and maize GBSS. The cDNAs can be used to produce plants with an increased capacity for producing starch, or a capacity to produce starch with an altered fine structure. They can also be used to isolate the corresponding genomic sequences from crop plants, to determine the contribution of the SSS gene to the net regulation of starch biosynthesis, and to modify the levels of starch produced by the plant. Transgenic plants (esp. maize) can be used to produce hybid plants which have higher rates of starch synthesis at temperatures above the normal optimum.
                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is that of the soluble starch synthase I gene. It can be used in the production of a hybrid polypeptide comprising a starch-encapsulating region (SER) fused to a payload protein. The hybrid polypeptide can be used to modified starches comprising the payload protein, selected fie.g. hormones, growth factors, antibodies, enzymes, dyes, immunoglobulins, etc. The modified starch can also be used to provide grain feeds enriched in amino acids. By encapsulathe payload protein in starch, it is more resistant to degradation by stomach acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          starch-encapsulating region a oducing protein(s) resistant

) EXSEED GENETICS

```
The specification describes a method for the production of non-glycogen-like polysaccharides in a host. The method comprises transforming a host, suitable for fermentation, with genes encoding starch- or glycogen synthesis enzymes, and fermenting the transformants. The specification also describes hosts transformed with a gene active in glycogen synthesis and at least one non-starch branching gene, involved in production of amylopectin or amylose in its original host. The method is used to produce plan-like starches by fermentation and non-food applications of starch. The present sequence is used in
                  roducing non-glycogen-like polysaccharides in bacteria, fungi or lants - transformed with genes for enzymes involved in starch or lycogen synthesis allows fermentative production of starches with

                                                                                                                                                                                                                                                                                                                                                           The sequence is that of the starch synthase coiding region from PEXS2. It can be used in the production of a hybrid polypeptide comprising a starch-encapsulating region (SER) fused to a payload protein. The hybrid polypeptide can be used to make modified starches comprising the payload protein, selected from, immunoglobulins, etc. The modified starch can also be used to provide grain feeds enriched in amino acids. By encapsulating degradation by stomach acids.

The present sequence is the corn soluble starch synthase (SSI) DNA sequence inserted into plasmid pSS42. Chimeric gene of pSS42 was cloned into the vector pKS17 for the generation of an antisense construct for suppression of SSI expression in corn. The starch fine structure derived from a grain of the cereal crop can be altered in the transformed cereal crop by changes in maylobectin ratio, amylopectin fine structure, increased abundance of very short amylopectin chains and in the degree of polymerisation of amylose. These modifications can be created by controlling the expression of non-GBSSI (non-granule bound starch synthase) in transgenic plants. Altered starches are useful in foods, paper, plastics or adhesives.
                                                                                                  1992
                                                                                                                                                                                                                  2111

The present sequence is the corn soluble starch synthase (SSI) DNA sequence comprising the SSI coding region of amino acids 1-494 inserted into plasmid pSS64-C5. The chimeric gene containing the zein promoter followed by the SSI gene fragment is used as a sense construct for preparation of transgenic corn expressing altered starch structure. The starch fine structure derived from a grain of the cereal crop can be altered in the transformed cereal crop by changes in amylose to amylopectin from a grain of the degree of polymerisation of amylopectin fine structure, increased abundance of very short amylopectin fine structure, increased abundance of waryoner These modifications can be created by controlling the expression of non-GBSSI (non-granule bound starch synthase) in transgenic plants. Altered starches are useful in foods, paper, plastics

US-08-572-951-3; Sequence 3, Application US/08572951; Sequence 10, SB24790; Patent No. 5824790; GENERAL INPORMATION:

```
GENERAL INFORMATION:

APPLICANT: Kossmann, Jens
APPLICANT: Springer, Franziska
APPLICANT: Springer, Franziska
APPLICANT: Abel, Gernot
TITLE OF INVENTION: DNA MOLECULES THAT CODE FOR ENZYMES
TITLE OF INVENTION: INVOLVED IN STARCH SYNTHESIS VECTORS BACTERIA TRANSGENIC
TITLE OF INVENTION: PLANT CELLS AND PLANTS CONTAINING SAID MOLECULES
NUMBER OF SEQUENCES: 17
